12

GRAPH

12.1 Purpose

The GRAPH program generates simple diagnostics and plots for some standard meteorological variables. The GRAPH code will process multiple times and vertical levels, computing the same diagnostics for each time and level. The GRAPH code will provide simple vertical interpolation capability, cross-section figures, and skew-T plots. The GRAPH program can overlay two plots. The GRAPH code is written to be used as a batch processor, so that all graphical choices are made from tables. The GRAPH code can process data from TERRAIN, REGRID, little_r and RAW-INS, INTERPF, MM5, NESTDOWN, LOWBDY, and INTERPB. But GRAPH code cannot plot boundary condition data. The GRAPH code does not produce any standard output for use by a subsequent program.

The GRAPH code in MM5 system is built on NCAR Graphics library (which is a licensed software: http://ngwww.ucar.edu, but part of it has become free which is sufficient to be used by all MM5 modeling system programs that require NCAR Graphics). It can be run on IBMs, Crays, workstations, and PC running Linux where NCAR Graphics is installed. When working on an IBM, a user can run GRAPH in batch or interactive mode. Examples of the interactive GRAPH use are shown in the section 12.7.

Note on compiling GRAPH on a PC:

When compiling on a PC running Linux using Portland Group Fortran compiler, it may require a library called libf2c.a. This library is required because NCAR Graphics library is compiled with GNU f77, while the GRAPH program requires PGF77 (or PGF90 - in order to deal with pointers). This library may or may not be available on your system. If it isn't, you may obtain it from the internet for free.

12.2 Typical GRAPH Jobs

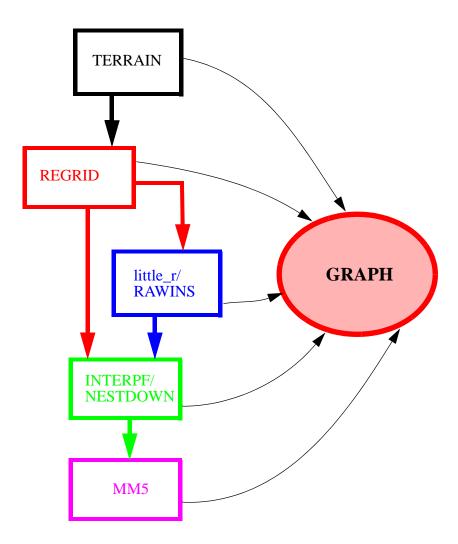

Fig. 12.1 Schematic diagram showing GRAPH accepting data from outputs of MM5 modeling system.

12-4 MM5 Tutorial

12.3 Plotting Table File: g_plots.tbl

This table is used to define times, levels and fields to be processed and plotted by Graph. An example is shown below:

TIME LEVELS: FROM 1993-03-13_00:00:00 TO 1993-03-14_00:00:00 BY 21600 (A)

PRESSURE LEVEL MANDATORY: FROM SFC TO PTOP (B)

PRESSURE LEVEL NON STANDARD: FROM SFC TO PTOP BY 3 (C)

SIGMA LEVEL: FROM 23 TO KMAX BY 5 (D)

TITLE: MM5 Tutorial (E)

PLOT T/F	FIELD	UNITS	CONTOUR	SMOOTH PASSES	OVERLAY FIELD	UNITS	CONTOUR INTERVAL	SMOOTH PASSES
T	TER	 	100	0	 			
T	WIND	m/s	5	0	BARB	m/s	2	0
TP500	HEIGHT	m	30	0	VOR	10**5/s	0	0
TI305	PV	PVU	1	0	P	mb	20	0
X	5	5	23	8	PSLV	mb	2	0
X	THETA	K	3	0	CXW	m/s	10	0
X	5	18	23	5	PSLV	mb	2	0
X	THETA	K	3	0	CXW	m/s	10	0
T	SKEWTLL	72469 DI	EN DENVER	, co :	39.75 -10	4.87		
T	SKEWTXY	STATION	IN (X,Y)	19	30	1		

Description of Table Header Rows:

(A)	TIME	with beginning and ending times given in YYYY-MM-DD_HH:MM:SS, and time increment given in seconds defined by the number after <i>BY</i> . If one doesn't use :SS, the increment should be in minutes, and if one doesn't use :MM, then the increment should be in hours. ' <i>BY 0</i> ' means to plot every output times.
(B)	MANDATORY	used for pressure level dataset (such as from DATAGRID and Rawins). Will plot every mandatory level from the maximum and minimum level requrested. ALL and NONE may also used to replace the entire string after the colon.
(C)	NON STANDARD	used for pressure level dataset. Will plot every mandatory level from the maximum and minimum level requrested. Optional use of <i>BY n</i> will make plots at every n levels. ALL and NONE may also be used to replace the entire string after the colon.
(D)	SIGMA	used for σ -level data. Will plot the levels specified by indexes (K=1 is at the top of the model). An increment is required, and defined by the number after <i>BY</i> . Can also use ALL or NONE.
(E)	TITLE	except for a colon (:), any alpha-numeric character can be used to make a simple 1 line, 80 character title

Description of Table Columns:

PLOT T/F	True or False to plot this field. Removing the line from the table has the same effect as F. If the user requests a cross section plot, the letter is X. If the user requests a plot on pressure level, the first 2 characters are TP, followed by the pressure value (TP500 is 500 mb level); if the user requests a plot on isentropic surface, the first 2 characters are TI, followed by the potential temperature value (TI330 is 330 K level). The last two options only work with σ data.
FIELD	a field name to be plotted. See complete list in Tables 8.1, 8.2 and 8.3. If the field is a skew-T, the interpretation of the following columns is changed (see the explanation below).
UNITS	units used on a plot. For some fields, there are different standard units available. If you don't know the unit, use '?'.
CONTOUR INTERVAL	real or integer values used to contour a plot. If you don't know what contour interval to use, use '0'. For a vector field (e.g. BARB), this value specifies the grid interval. For streamline field (VESL), this value specifies how sparse or dense streamlines are drawn.
SMOOTH PASSES	number of passes of the smoother-desmoother used for each horizontal plot.
OVERLAY FIELD	a field name for the overlay plot. May be left blank.

To create pressure-level plot from sigma-level data:

TP500 HEIG	HT	m		30		0	П	VOR	10*	*5/ន		0			0
To create isentropic-level plot from sigma-level data:															
TI305 PV	ı	PVU		1	I	0	П	P	ml	b		20	ı	0	

To plot skew-T:

If the plot is a skew-T (SKEWTLL or SKEWTXY), the UNITS column is used to define location name, and lat/long or X/Y appear in the following two columns. e.g.

T	SKEWTLL	72469	DEN	DENVER,	CO	39.75	-104.87			
---	---------	-------	-----	---------	----	-------	---------	--	--	--

To plot a vertical cross-section:

For a cross-section plot, the location is defined by the 4 numbers in the columns following 'X', and they are in the order of X1, Y1, X2, and Y2. e.g.,

X	5	5	23	8	PSLV	mb	2	0
X	THETA	K	3	0	CXW	m/s	10 0	

12-6 MM5 Tutorial

12.4 Default Option Settings File: g_defaults.nml

This is a namelist file and it is optional. If this file exists in the current working directory when the Graph program starts executing, the file's contents replace the previously set defaults in the Fortran code. Since this is a namelist structured file, lines may be removed. Comments after ';' are not allowed on most platforms, but are shown here for easy reference only.

```
&JOEDEF; defaults for graph
     ISTART=1,
                            ; sub-domain plot beginning I location
     JSTART=1,
                           ; sub-domain plot beginning J location
  ;
     IEND=37,
                          ; sub-domain plot ending I location
     JEND=49,
                           ; sub-domain plot ending J location
                           ; line width, 1000 is thinnest
     LW1=2000,
                            ; line width for overlay plot
     LW2=2000,
     DASH1=-682,
                           ; dash pattern, standard NCAR GKS method
     DASH2=-682,
                           ; 4092, 3640, 2730, -682
     COLOR1=12, COLOR4=12,
     COLOR2=9,
                 COLOR5=9,
     COLOR3=8,
                 COLOR6=8,
     HDRINFO=F,
                           ; true=print header and stop
     LOGP=0,
                           ; cross section: 0=linear in p; 1=linear in ln p
     XPTOP=200.,
                           ; top of cross section plots (mb)
     LABLINE=1,
                           ; 0: no contour line labels
     LABMESG=0,
                           ; 1: no message below conrec plot
     NOZERO=0,
                            ; 0: allow zero line; 1:no min/max zero line;
                            ; 2: no zero whatsoever
                   ; 1: use high resolution US county line/China coastline
     IHIRES=0,
&END ;
```

Description of variables in the namelist:

TOTAL DOT

ISTART	integer	for a subdomain plot, this is the I-direction starting point
JSTART	integer	for a subdomain plot, this is the J-direction starting point
IEND	integer	for a subdomain plot, this is the I-direction ending point
JEND	integer	for a subdomain plot, this is the J-direction ending point
LW1	integer	line width for the first plot; 1000 is the thinest
LW2	integer	line width for the overlay plot
DASH1	integer	dash pattern for the first plot; standard NCAR GKS method. A '-'
		before a number means contour of positive values is solid, nega-
		tive values is dashed
		682: shorter-dashed line
		2730: short-dashed line
		3640: medium-dashed line
		4092: long-dashed line
DASH2	integer	dash pattern for the overlay plot
COLOR1	integer	color index for the first contour plot, labeled lines
COLOR2	integer	color index for the overlay plot, labeled lines
COLOR3	integer	color index for a dot-point plot, labeled lines
COLOR4	integer	color index for the first contour plot, unlabeled lines

COLOR5	integer	color index for the overlay plot, unlabeled lines
COLOR6	integer	color index for a dot-point plot, unlabeled lines
HDRINFO	logical	T: will only print record header
LOGP	integer	for cross section plots: whether the vertical coordinate is plotted
		in linear p (LOGP=0), or log p (LOGP=1)
XPTOP	real	top of a cross section plot (in mb)
<i>LABLINE</i>	integer	=0: no contour line labels
<i>LABMESG</i>	integer	=1: no message below conrec plot
NOZERO	integer	=1: no min/max zero line; =2: no zero line whatsoever
<i>IHIRES</i>	integer	=1: use high resolution US county/Asia coastline

To use higher resolution US county lines or Asia coastline, set IHIRES=1, and name the outline file to be *hipone.ascii*. These files may be downloaded from *ftp://ftp.ucar.edu/mesouser/Data/GRAPH* directory.

12.5 Map Options File: g_map.tbl

This table is used to modify map background specifics for a Graph plot.

LL DASH INT LB LSZ LQ	MAP DETAILS P TTL TSZ TQL	OUT DOT LW SP
A PB D M 12 00) Y Y 8 00	PS N D
	MAP COLORS	
LL LINES LABELS TITLE ST	TATES COUNTRIES	CONTINENTS PERIMETER
1 1 1 1	1	1 1

Description of variables in g_plots.tbl: (Text is provided by Dr. Mark Stoelinga of University of Washington.)

LL	lat/lon lines over land only (L), water only (W), none (N), or both land and water (D, A, or E)
DASH	lat/lon lines are dashed large (L), medium (M), small (SM), tiny (T), solid (SO), publ. style (P), or default (D) [LL.ne.N]
INT	lat/lon grid interval in degrees, or D for default [LL.ne.N]
LB	M for only MAPDRV labels (lat/lon on perimeter), N for none, or D or A for both
LSZ	lat/lon label size, 1 to 25 [LB.ne.N]

12-8 MM5 Tutorial

LQL	label quality: [LB.ne.N] 00 - Complex characters / High quality 01 - Complex characters / Medium quality 02 - Complex characters / Low quality 10 - Duplex characters / High quality 11 - Duplex characters / Medium quality 12 - Duplex characters / Low quality D - Default = 11
P	draw just a line perimeter (N) or a line perimeter with ticks (Y) [DASH.ne.P.or.LL.eq.N]
TTL	title flag: read the next two title parameters (Y) or skip to outline parameter (N)
TSZ and TQL	the same as LSZ and LQL except they refer to the title [both TTL.eq.Y]
OUT	determines which geo-political outlines will be drawn: NO - no outlines CO - continental outlines only US - U.S. State outlines only PS - Continental + International + State outlines PO - Continental + International outlines
DOT	determines whether geo-political boundaries will be dotted (Y) or solid (N) [OUT.ne.NO]
LW	gives the line width, in multiples of default (which is 1000 "units"). D gives default line width. [OUT.ne.NO.and.DOT.eq.N] (LW=2 would double the line width for geographic boundaries)
SP	gives dot spacing. Default (D) is 12 [OUT.ne.NO.and.DOT.eq.Y]

With each parameter is given a conditional statement. If that conditional statement is not met, then that particular box should be made blank. The most common error that occurs when the routine attempts to read this table is "Too many entries on line", which simply means that the routine expected a box to be blank, but it wasn't.

One can also do color-filled maps. To do so, add the following in the g_map.tbl:

MAP FILL												
WATER	SIX COLOR	INDICIES	WITH	WHICH	то	COLOR	IN	THE	MAP			
1	2	2	2	l	2	l	2			2		

In this example, the water will be colored white, and land light grey according to the color tabel described below.

12.6 Plot Color Options File: g_color.tbl

This table is used to define the color codes referred in the Graph program.

COLOR TABLE							
COLOR	RED	GREEN	BLUE	NUMBER			
WHITE	1.00	1.00	1.00	1			
LIGHT GRAY	0.66	0.66	0.66	2			
DARK GRAY	0.40	0.40	0.40	3			
BLACK	0.00	0.00	0.00	4			
SKY BLUE	0.20	0.56	0.80	5			
BLUE	0.00	0.00	1.00	6			
LIGHT YELLOW	0.80	0.80	0.00	7			
MAGENTA	1.00	0.00	1.00	8			
YELLOW	1.00	1.00	0.00	9			
GREEN	0.00	1.00	0.00	10			
FOREST GREEN	0.14	0.25	0.14	11			
CYAN	0.00	1.00	1.00	12			
TAN	0.40	0.30	0.20	13			
BROWN	0.25	0.20	0.15	14			
ORANGE	1.00	0.50	0.00	15			
RED	1.00	0.00	0.00	16			
MID-BLUE	0.00	0.50	1.00	17			
DULL MID-BLUE	0.00	0.15	0.30	18			
BRIGHT FOREST GREEN	0.20	0.40	0.20	19			
DULL ORANGE	0.60	0.30	0.00	20			

To make a color contour plot, change the background color from black to white using the following g_color.tbl:

COLOR TABLE				
COLOR	RED	GREEN	BLUE	NUMBER
WHITE	1.00	1.00	1.00	0
BLACK	0.00	0.00	0.00	1
LIGHT GRAY	0.66	0.66	0.66	2
DARK GRAY	0.40	0.40	0.40	3
BLACK	0.00	0.00	0.00	4

and change color used for maps in the MAP COLORS section of the *g_map.tbl* from 1 to a color code other than white for borders, tick marks, and map background.

12-10 MM5 Tutorial

12.7 How to Run GRAPH

Obtaining Graph tar file

1) ftp ftp.ucar.edu

To run GRAPH interactively, the first step is to obtain the GRAPH tar file. The GRAPH tar file, *GRAPH.TAR.gz*, can be otained from ~mesouser/MM5V3 (or /fs/othrorgs/home0/mesouser/MM5V3) from NCAR's IBM, /MESOUSER/MM5V3/GRAPH.TAR.gz on MSS, or from the anonymous site (ftp://ftp.ucar.edu:mesouser/MM5V3). This tar file contains the GRAPH source code, makefiles, as well as the table files required to produce plots.

To get the tar file from the anonymous ftp site:

cp ~mesouser/MM5V3/GRAPH.TAR.gz .

```
2) login as anonymous
3) use your full email address as the password
4) cd mesouser/MM5V3
5) set the transfer to binary (or image), usually this is just "bin"
6) get GRAPH.TAR.gz
7) quit
Or to get the tar file on NCAR's IBM:
cd /ptmp/$USER
msread GRAPH.TAR.gz /MESOUSER/MM5V3/GRAPH.TAR.gz
or
```

Compiling Graph code

Once you have the *GRAPH.TAR.gz* on the IBM's working directory or on the local workstation, the building process is to gunzip the file, untar the file and make the executable.

```
    gunzip GRAPH.TAR.gz
    tar -xvf GRAPH.TAR
```

After untarring the file, you should find the GRAPH directory and the following in GRAPH directory among others:

```
Makefile
g_color.tbl
g_defaults.nml
g_map.tbl
g_plots.tbl
graph.csh
```

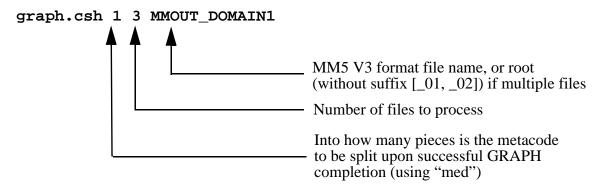

- 3) If your dataset dimensions are greater than 200x200x40, you need to edit two files in src/directory: *scratch.incl* and *data.incl*
- 4) type "make", and this will create a graph executable called *graph.exe*. (if working on NCAR's IBM, a user can simply copy the *graph-run-ibm.tar.gz* file from

- ~mesouser/MM5V3/IBM, unzip and untar it. An executable is inside)
- 5) edit the *g_plots.tbl* and *g_defaults.nml* (if needed) files.
- 6) if a user is working on NCAR's IBM, he/she needs to retrieve data from MSS by typing the following:

msread MMOUT_DOMAIN1[_01 through _99] MSSfilename & The '&' puts the msread command in the background.

Running Graph

Program Graph can only process output from one domain at a time. To run Graph, type "graph.csh 1 1 MMOUT_DOMAIN1", or

The graph.csh tries to figure out what options you have placed on the command line. For example, a) to run graph with one data file:

graph.csh 1 1 MMOUT_DOMAIN1

b) to run graph with 3 files named MMOUT_DOMAIN1, MMOUT_DOMAIN1_01, MMOUT_DOMAIN1_02:

graph.csh 1 3 MMOUT_DOMAIN1

c) to run graph with 3 files named MMOUT_DOMAIN1_00, MMOUT_DOMAIN1_01, MMOUT DOMAIN1_02:

graph.csh 1 3 MMOUT_DOMAIN1

d) to run graph with 3 files named MMOUT_DOMAIN1_00, MMOUT_DOMAIN1_01, MMOUT_DOMAIN1_02:

graph.csh 1 3 MMOUT_DOMAIN1*

12-12 MM5 Tutorial

Viewing Graphic Output

The plot files generated by Graph are metacode files called 'gmeta' (and gmeta.split1, gmeta.split2, etc. if you choose to split the file), which can be viewed by NCAR Graphics utility idt, and/or transformed to postscript files using ctrans (also an NCAR Graphics utility). For example, to transfer a gmeta file to postscript file,

```
ctrans -d ps.mono gmeta > gmeta.ps (for black-white plot),
or
ctrans -d ps.color gmeta > gmeta.ps (for color plot)
```

Or to view the output interactively using an interface,

idt gmeta

12.8 Available 2-D Horizontal Fields

Table 8.1 List of 2-D horizontal fields available for plotting.

Field ID	Description	Default Units	Optional Units	Optional Units	Optional Units
CORIOLIS	Coriolis parameter	1/s			
ICLW	integrated cloud water	cm	mm	in	
IRNW	integrated rain water	cm	mm	in	
LATITDOT	latitude	degrees			
LI	lifted index	K	С		
LNDUS	land use categories	(no units)			
LHFLUX	surface latent heat flux	W/m ²			
LONGIDOT	longitude	degrees			
LWDOWN	longwave downward radiation	W/m ²			
MAPFACDT	map scale factor	(no units)			
PBL HGT ⁷	PBL height	m			
PRECIPT	total accumulated precipitation	mm	cm	in

THETAE	equivalent potential temperature	K	С	F	
TKE	turbulent kinetic energy	J/kg			
U	u-component of wind	m/s	kt	cm/s	
V	v-component of wind	m/s	kt	cm/s	
VAB	absolute vorticity	10**5/s	1/s		
VECT	horizontal wind vectors	m/s	kt	cm/s	

12-18 MM5 Tutorial

Field ID	Description	Default Units	Optional Units	Optional Units	Optional Units
VESL	horizontal wind streamlines	m/s			
VOR	relative vorticity	10**5/s	1/s		
W	w-component of wind	m/s	kt		
WIND	wind speed	m/s	kt	cm/s	

12.11 Some Hints for Running GRAPH

- make sure the following line is included in your .cshrc file on NCAR's IBM or your local computer:
 - setenv NCARG_ROOT /usr/local or setenv NCARG_ROOT /usr/local/ncarg
- NCAR Graphics has recently been upgraded to include better country/poloitcal boundaries.
 This is especially true over Europe. GRAPH's default is to use NCAR Graphics version 4.1, but GRAPH can also run with older/newer versions.
 - If you have an older version, remove the "-DNCARG41" directive from the Makefile.
 - If you have NCAR Graphics version 4.2, change the "-DNCARG41" directive in the Makefile to "-DNCARG42".
- The GRAPH program uses the information in the record header to define the size and location of the data. This limits the "wrong" data that the user can provide to be related to the requested fields and levels to be plotted.
- GRAPH prints out information to allow you to track the program's status. It should inform
 the user that it is processing each of the requested time periods, and for each of the
 requested variables and levels.
- If the GRAPH program is not processing the time that you have requested, and it should be based upon the intervals that you have set, ask GRAPH to plot every time by setting time increment to be 0.
- GRAPH only vertically interpolates data that is on a σ coordinate.
- Contour intervals for precipitation are fixed for the RAIN and RTEND fields and user modifiable for the PRECIP fields.
- Do not request a subdomain and also process soundings. The GRAPH program may not place the sounding at the correct location for the large domain.
- Errors related to the NAMELIST or other temporary files are common when porting GRAPH to a different architecture. Use the NAMELIST format in the architecture's FORTRAN manual. Make sure and remove all temporary files and links prior to each initiation of the GRAPH C-shell.
- When GRAPH is compiled on a different architecture, the length of the records for the direct access files must be specified in bytes (4 or 8 per word) or words. This information is found in the include file word_length.incl.
- If you get the following, and Graph stops,
 NEED MORE DATA SPACE
 it means that you need to increase the dimensions in the data.incl and scratch.incl files.
- If you get error message related to 'Direct Access Files', it is usually an indication that the dimensions specified in data.incl and scratch.incl files are not large enough, or the running memory is not large enough, or the word length is not correct for your particular computer architecture.

12.15 An Alternative Plotting Package: RIP

RIP (which stands for Read, Interpolate and Plot), is a graphical program developed by Dr. Mark Stoelinga of University of Washington. This program is a popular alternative graphics program to GRAPH, especially when it comes to color plots. This program is also based on NCAR Graphics.

A descriptions of this package is available in Appendix G.
